

Python Programming Assignment Report

Mathematical Calculator (MC)

This project implements a simple graphical calculator using Python's Tkinter library. It supports addition (+), subtraction (-), multiplication (*), division (/), floor division (\), exponent (^), modulus (%), clear (C), equals (=), and OFF functions. The interface is interactive and user-friendly.

Personal Pocket CGPA Calculator (PPC)

This console-based application calculates a student's CGPA by accepting course units and scores, converting scores to grade points using standard grading rules, computing the weighted grade points, and displaying the CGPA and degree classification.

Software Used

Python 3.x, Tkinter, Git, GitHub.

Testing

Both programs were tested with valid inputs. The calculator performed arithmetic operations correctly, while the CGPA calculator correctly computed grade points, CGPA, and classification.

Conclusion

The assignment demonstrates the use of Python for GUI development, selection control statements, arithmetic operations, and problem solving.
